

M-3000 HG Control Upgrade to Omnicon

Controls

Replace obsolete components

Features

- 19" Touch-screen panel for operator input
- Logical layout with easy-to-learn graphics
- CIP4 compatibility
- Open architecture
- Remote diagnostics via modem or VPN
- Easy navigation – minimum screen layers
- One-button return to main screen
- Eliminates hard to find and obsolete parts

HGControl, while still functioning well on a number of Goss International presses today, is becoming more and more difficult to support from a service, engineering, and parts standpoint.

Rather than replacing one board at a time and continuing to experience problems with obsolete components, this upgrade replaces the obsolete 575 PLC controllers as well as the QNX PC.

The controls are retrofitted to the current control system scheme – Omnicon. The system is similar to the one on current presses in terms of hardware, console look and feel, and connectivity and will provide a path for future upgrade possibilities like DigiRail™ or folder additions. The new system provides full OEM backing for service and technical support, something that a third party supplier will not be able to offer.

It makes full use of today's computer technology, and is an open-architecture system able to be expanded for tomorrow's technology advancements.
