

Magnapak Omnicon RTX Enhancement

Packaging center

Address parts obsolescence

Features

- Current hardware platform
- Supportable components
- Latest version of Goss software
- Back-up capability available

Operational benefits

- Less downtime
- Reduced maintenance costs

The PCPC computer installed in older Magnapak inserters utilized some components that are no longer available. This enhancement replaces the PCPC while also providing the latest version of the Goss software for the machine.

The new software is the current version that is sold with the newest Magnapak inserter, and the new code offers some advantages and new features over the old version. The existing PCPC will be removed and replaced with the latest version of the RTX hardware and software. The operation of the new controls will be verified during the commissioning process.

An additional RTX PCPC can be purchased as a back-up and will be installed at this time. Older RTX PCPCs can be retained as a spare with the addition of a new hard drive for the HMI, or can be traded in towards the newest RTX version.
